Agents of Change: Reimagining Retail Banking and Insurance with Agentic AI

Background: FinFable Financial Group (FFG)

FinFable Financial Group is a mid-sized Canadian financial services organization with two major business lines — **Retail Banking** and **Insurance**.

Over the past decade, FinFable has grown through a series of acquisitions, creating a broad but complex portfolio of products — mortgages, personal loans, credit cards, auto insurance, and group life insurance.

Today, the firm faces rising customer expectations, mounting regulatory requirements, and fierce competition from digital-first disruptors. While FinFable has made incremental progress in automation and analytics, its operations remain largely **reactive, fragmented, and human-intensive**.

The new CEO, **Rhea Quantz** (fictional), has launched an enterprise-wide initiative to explore how **Agentic AI** — autonomous, reasoning-capable AI systems — could **reimagine FinFable's customer and operational experience** across its retail banking and insurance arms.

Problem Statement

FinFable's leadership believes Agentic AI could deliver transformative value — automating end-to-end workflows, augmenting human agents, and providing proactive insights — but the organization lacks a unified vision and strategy for how to deploy it.

FinFable's executive committee has engaged your consulting team to answer a single, strategic question.

'How can FinFable Financial Group deploy Agentic AI across its Retail Banking and Insurance businesses to create intelligent, autonomous operations — improving customer experience, efficiency, and risk management — while ensuring ethical governance and regulatory compliance?'

Your team will design a concise strategy answering:

- Which **high-impact use cases** should FinFable pursue first?
- What **roadmap** will make adoption successful?
- How can the company ensure **sustained business value** (benefits justify the costs) within 24 months?

Teams may make reasonable assumptions about data, technology maturity, or operating models — as long as they are logically reasonable in the context, to offer participants some creative freedom.
